

Cleaning and Maintaining of Granite in the Bathroom

Granites or granite-like natural stones (granulites, gneisses and quartzites) are very resistant, but rarely completely resistant to stains.

A treatment of protection and care adapted to the absorbency of the stone significantly improves its properties. The following tips will help you to properly care for your natural stone bathroom and keep it beautiful for many years.

General information

In general, granites are acid-resistant, which makes them particularly easy to maintain. However, some hard rocks are now also referred to as granite that do not have this property. Check the acid resistance of your stone before using bathroom cleaners and the like.

Additional easy-care equipment

In bathrooms and similar systems, we generally recommend impregnation with Lithofin MN Stain-Stop. This makes the flooring water- and oil-repellent and thus protects it against stains in the best possible way. The beautiful new appearance of the surface is retained for years – and with the least amount of maintenance.

Lithofin MN Stain-Stop is suitable for polished and sanded surfaces. The appearance does not change, a slight deepening of the color may occur. The processing is simple. For industrial and professional use only.

△ Important: Impregnations can only be used on completely dried and absorbent surfaces. The creation of a test area is recommended. The waterproofing treatment should be repeated once a year in areas exposed to moisture.

LITHOFIN special products for marble and other natural stones are available from tile and natural stone retailers.

This information can and should only provide non-binding advice. The use of a product must be adapted to the local conditions and the surfaces to be treated. The suitability of the product shall be determined on a test area.

Regular maintenance

For normal use, it is sufficient to regularly wipe the pads with a damp cloth. Always add a dash of Lithofin MN Easy-Care to the mopping water – this way you clean and care at the same time.

You can clean and maintain small areas particularly effortlessly with Lithofin MN Easy-Clean and at the same time enhance the protective effect of the impregnation. Simply spray on and wipe off with a damp cloth.

Additional care: Occasionally treat stressed small areas such as washbasins with Lithofin MN Polish cream. This gives the surface additional protection and shine.

Tip: You should always wipe off water splashes, especially hard water, as well as creams, lotions, soap residues, etc. as soon as possible to prevent stains. Under no circumstances should leaching soft soaps or strongly grease-dissolving agents be used.

Once limescale deposits have formed on acid-resistant natural stone surfaces, they can be easily removed with Lithofin KF Active-Clean. Pre-wet the surface, then put the cleaner diluted approx. 1:15 on a sponge, wipe the surface and then wash with clear water.

The recommended products are optimally matched to each other and support the effect of the impregnation. The health safety was confirmed by an independent institute in accordance with the provisions of the LFGB and EU Regulation 1935/2004.
